Burlington's electric grid starts operating in 1886 using hydroelectricity from the Winooski River

Victory, Vermont is one of the last two towns in the state to connect to the grid – in 1963.

Where is the SHEI?

ISO-NE determines SHEI limits at or below which the system can withstand potential system contingency events (e.g., line outage, equipment failure)

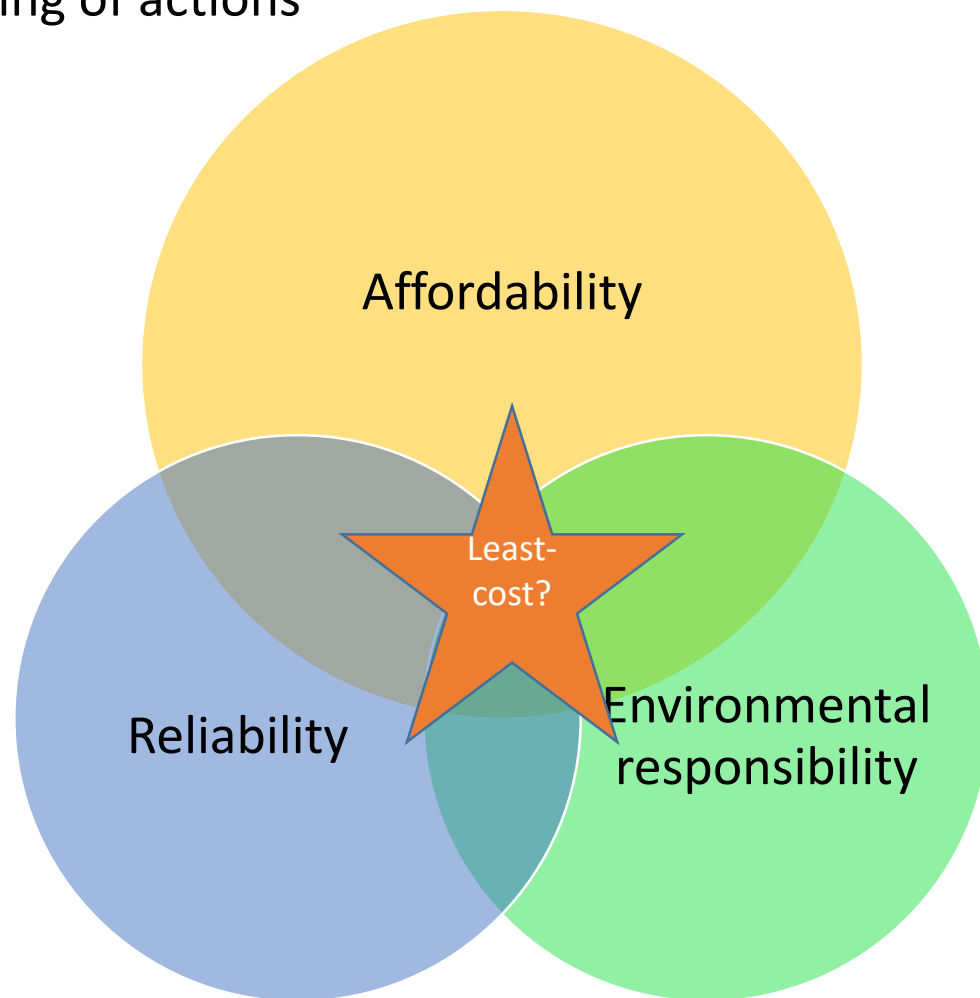

- Total load is between 20 MW and 60 MW
 - Average load is 35 MW
- Total generation is 430 MW (all at maximum potential output)
 - Including Highgate 225 MW HVdc converter – largest resource within SHEI
 - Highgate typically runs at maximum capacity almost 24 hours a day

Generation dispatchable by ISO-NE		Generation not dispatchable by ISO-NE	
Utility-scale wind	105 MW	Landfill methane	8 MW
Utility-scale hydro	35 MW	Total solar PV (small & large)	11 MW
Utility-scale thermal (rarely runs)	45 MW	Other standard offer (hydro, farm methane)	3 MW

- Defining objectives of and roles in grid modernization
- Sequencing, prioritization, and pacing of actions
 - Choreography of generation & load
 - Rate design & price signals
 - Beneficial electrification
 - Flexible loads
 - DERs
 - Grid sensing & management
 - Grid maintenance & redundancy
- Enabling multiple future scenarios
 - No- or low-regrets investments
 - Encouraging innovation
 - Minimizing risk to ratepayers
 - Awareness of cross-subsidies
 - Societal vs. customer benefits
 - Avoiding perverse outcomes

Act 53 Report:
A Report to the Vermont General Assembly on the Issue
of Deploying Storage on the Vermont Electric
Transmission and Distribution System

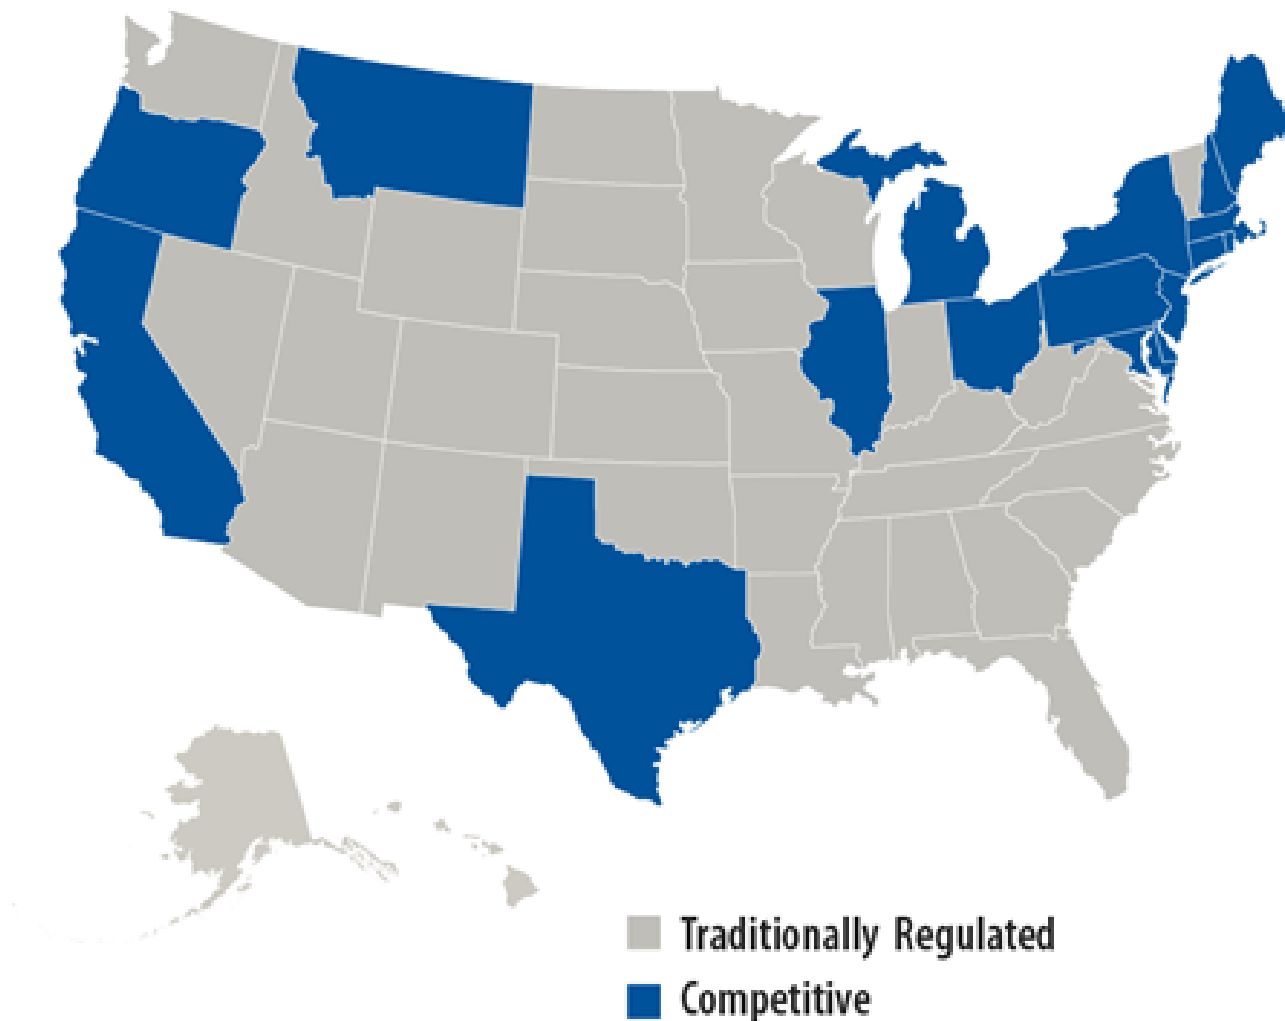

Final Report – November 15, 2017

Act 53 Storage Study

“...we view energy storage as a means to an end – rather than an end in and of itself – and thus many of our recommendations focus on pursuit of storage within the broader pursuit of a clean, efficient, reliable, and resilient grid in the most cost-effective manner for ratepayers.”

State energy policy

30 V.S.A. § 202a

It is the general policy of the State of Vermont:

(1) To assure, to the greatest extent practicable, that Vermont can meet its energy service needs in a manner that is adequate, reliable, secure, and sustainable; that assures affordability and encourages the State's economic vitality, the efficient use of energy resources, and cost-effective demand-side management; and that is environmentally sound.

(2) To identify and evaluate, on an ongoing basis, resources that will meet Vermont's energy service needs in accordance with the principles of least-cost integrated planning; including efficiency, conservation and load management alternatives, wise use of renewable resources, and environmentally sound energy supply.

Ownership options & delivery pathways

Battery control	Benefits	Challenges
Utility	<ul style="list-style-type: none"> -Potentially best positioned to deploy storage where it is most beneficial to the grid, and in the near term, to hit peaks -Utility can usually capture market benefits on behalf of all ratepayers -Utility can capture reliability benefits on behalf of multiple customers -Can be grid-scale or aggregated distributed storage 	<ul style="list-style-type: none"> -Can crowd out other entities from participating in this market space -Projects must benefit ratepayers and therefore tend to prioritize monetizable benefits -Selection of one technology or software to minimize investment and risk may discourage exploration of newly emerging products
Customer	<ul style="list-style-type: none"> -Potentially best positioned to address on-site reliability -Customer can tailor system to needs -Customer can place a value on reliability 	<ul style="list-style-type: none"> -Without shared access/control by utility or third party, difficult to capture sufficient benefit streams
Third party	<ul style="list-style-type: none"> -Can capture market values and potentially resiliency/integration/reliability benefits for utilities and customers 	<ul style="list-style-type: none"> -Rate design and software platforms to allow shared access and benefits still under development -Slim margins when values shared with many -Coordination to allow full realization of values by all parties challenging

Exploring Storage Programs and Policies

- Utility planning exercises
- Rate design, tariffs, and distinct pricing of storage-related services
- Energy assurance efforts
- Regulatory review process and criteria
- Interconnection standards
- Modification of existing or development of new programs/incentives
- Procurement targets
